Title- Smart Government Scheme Finder

Problem Statement-
Despite the availability of numerous government welfare schemes for different sections of society, many eligible citizens remain unaware of these initiatives or face difficulties in accessing them due to scattered information, complex eligibility criteria, and lack of user-friendly platforms. Existing systems require manual searching and provide limited personalization, making the process time-consuming and confusing. This results in underutilization of resources and prevents benefits from reaching the intended beneficiaries. Therefore, there is a need for an intelligent, centralized, and user-friendly system that simplifies scheme discovery and provides personalized recommendations efficiently.

Description:
The Smart Government Scheme Finder is a web-based application designed to help users easily identify government schemes they are eligible for. The system collects user details such as age, income, occupation, gender, and social category, and processes this data using a rule-based eligibility engine. Based on this, it recommends relevant schemes along with clear explanations like *"Why Am I Eligible?"*.
The platform provides a centralized database of schemes, reducing the need for manual searching across multiple websites. It features a simple and user-friendly interface, making it accessible to users with basic digital knowledge. Additionally, a chatbot is integrated to assist users in understanding schemes and resolving queries.
This system improves awareness, accessibility, and transparency of government welfare programs while ensuring that benefits reach the right individuals efficiently.

Technology Used:
Client-Side (Frontend)
- **HTML**
- **CSS**
- **Javascript**

Server Side(Backend)
- **PHP**

Database:
- **MYSQL**

Other Tools and Technologies

- **XAMPP Server**

Layout Design

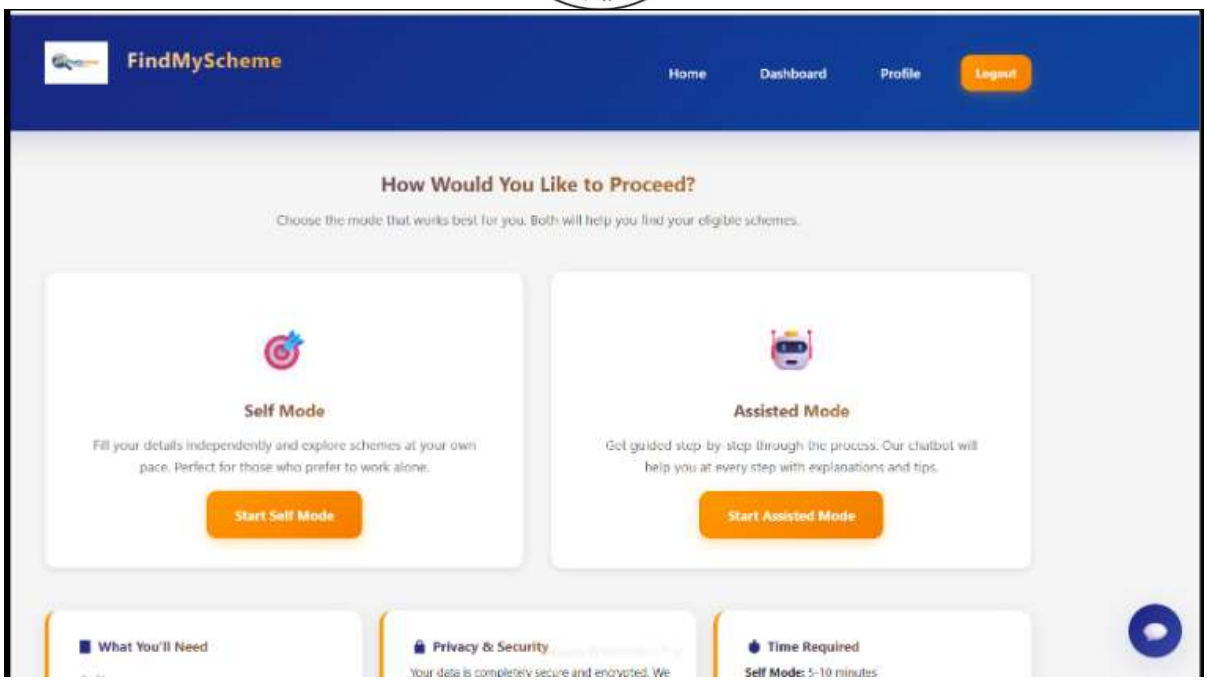
Department of Computer Science and Engineering(Data Science)



Database Design-
The system uses a **MySQL database** to store scheme and user-related data.

Main Tables:

1. **Users Table**
    - user_id
    - name
    - age
    - gender
    - occupation
    - income
    - category
2. **Schemes Table**
    - scheme_id
    - scheme_name
    - category
    - benefits
    - eligibility_criteria
3. **Eligibility Rules Table**
    - rule_id
    - scheme_id
    - conditions (age, income, etc.)

Conslusion-

The Smart Government Scheme Finder successfully addresses the challenges of limited awareness and accessibility of government welfare schemes. By using a rule-based eligibility system, it provides accurate and personalized recommendations based on user data. The system reduces manual effort, improves transparency, and enhances user experience through features like chatbot assistance and clear eligibility explanations. Overall, it bridges the gap between citizens and government services, promoting efficient utilization of welfare programs and supporting inclusive development.
